Wastewater Reuse for Agriculture: Development of a Regional Water Reuse **Decision-Support Model (RWRM) for Cost-Effective Irrigation Sources**

Introduction

Wastewater Reuse Facts

- California (since 1890)
- Agricultural water use: 35-45 MAF per year
- Treated wastewater: 5 MAF per year
- Current wastewater reuse: 450-580 thousand AF per year
- Israel (since 1948)
- 75% of wastewater is reused for agricultural irrigation \checkmark
- Australia (since 1990s)
- 10% of water used in mainland capital cities is reused for \checkmark toilet flushing and landscape irrigation
- Wastewater Reuse for Irrigation
 - Cost reduction in synthetic fertilizers
 - Suitability for Irrigation
 - Salinity
 - Heavy metals
 - Pathogens
 - Potential PPCPs and EDCs

Objectives

- Develop a regional water reuse decision-support model (RWRM)
 - Cost-effective irrigation solutions
 - Citrus
 - Turfgrass (Unrestricted vs. Restricted access)
 - Cost reduction in synthetic fertilizers

Model Scenarios

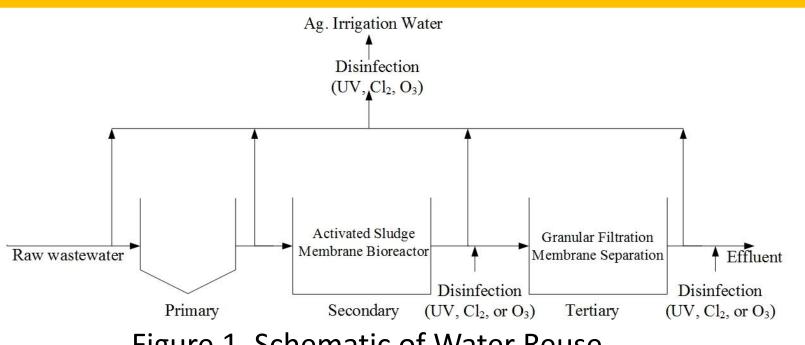

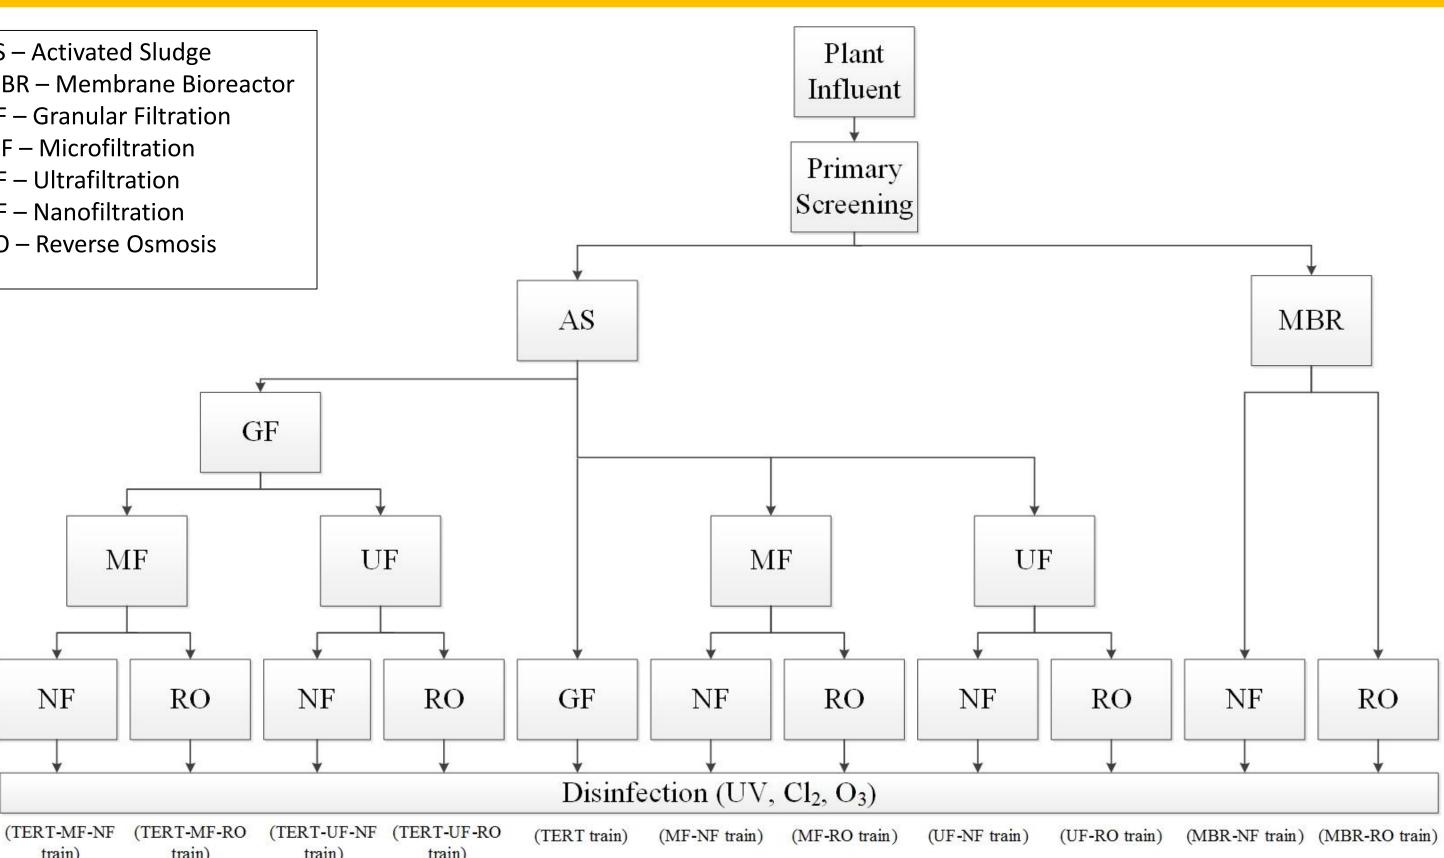

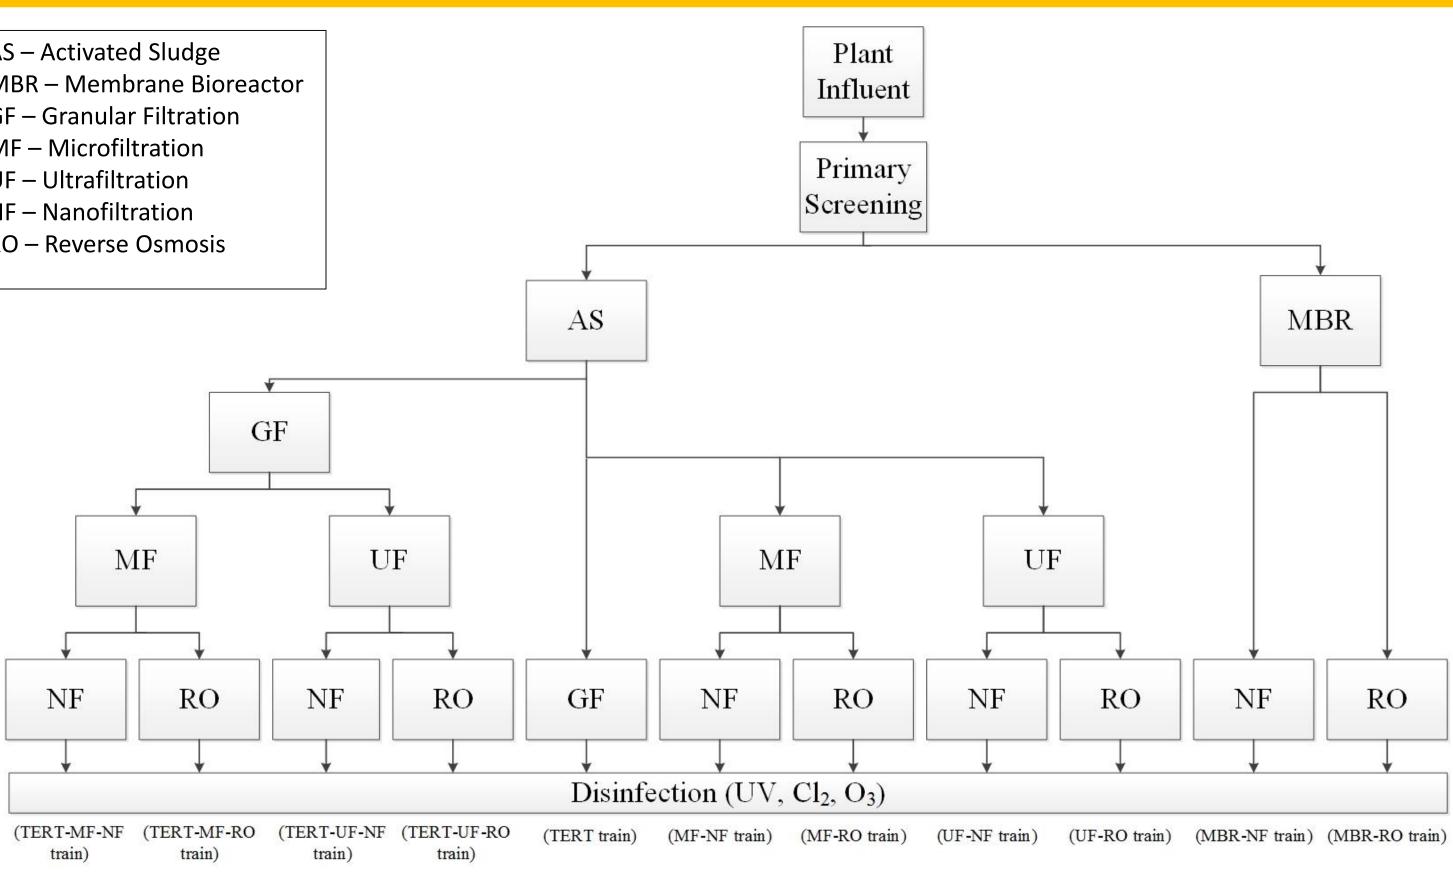

Figure 1. Schematic of Water Reuse

- Scenario A: With crop nutrient guidelines (Baseline)
 - Using irrigation guidelines for each crop
 - Based on average concentrations of constituents of interest in typical irrigation surface/groundwater
- Scenario B: Without crop nutrients guidelines
 - Insufficient nutrients in wastewater to cause harm
- Scenario C: Without crop nutrient and bicarbonate guidelines Residual Sodium Carbonate (RSC) ≤ 1.25 meq/L

Conclusions

- RWRM optimized blending combinations across different treated municipal wastewater effluents with the lowest cost from the MF-RO train
- The most cost-effective irrigation solution was found without crop nutrients and bicarbonate constraints
- The driving force behind the high costs and lower nutrient concentration outcomes was RO fraction
- Scenario C offered maximum cost saving on synthetic fertilizers

Future Work

- Effect of drought on the quality of the discharge effluents from wastewater treatment plants into streams and groundwater systems
- Impacts of drought on agricultural production
- Design efficient wastewater treatment processes based on the characteristics of demand and provide low-cost reliable water within urban scarce water environments
