PROOF THAT POROUS ASPHALT CAN SUCCEED IN A MIDWESTERN CLIMATE

(KICKING ASPHALT – THE TRUTH ABOUT POROUS PAVEMENT!)

Valerie Strassberg P.E.
Nature's Voice Our Choice
Wednesday, October 5th, 2011

PRESENTATION OUTLINE

1. Project Overview
2. NVOOC Involvement
3. Importance of Monitoring
4. Observations & Findings
5. Conclusions
6. Next Steps

THE INDUSTRY TALK

The Hypothesized Benefits:

- Decreased flooding from sheeting runoff
- Increased friction when icy
- Less salting required
- Increased infiltration and groundwater recharge
- Improved water quality
- Minimized and/or elimination of storm sewer pipe
- Reduced carbon emissions
- Ideal for use with bio-infiltration

WHY SYLVAN AVE?

- The WRMEC program mission is to bring public service to the engineering field.
- In light of a rapidly changing climate there are two opposing forces to adaption and mitigation:
 1. *A need to see tangible projects that can support theoretical solution and*
 2. *A nation with roughly 19,000 municipal governments for which extreme budget and closely held purse strings preclude many pilot (risky) projects.*

WHY SYLVAN AVE?

NVOC's interest in flow monitoring on Sylvan Ave:

1. Lack of information and long-term results for performance, benefits, and economics.
2. The project is in our own backyard – so why not!

MONITORING OBJECTIVE

One Big Question:

What are the positive residential and environmental impacts of a porous pavement street?

POROUS STREET DESIGN

3 - Ideal Outcomes

1. Decrease Flooding
&
Increase Infiltration

POROUS STREET DESIGN

3 Ideal Outcomes

2. Reduce and/or eliminate pipe

POROUS STREET DESIGN

3 - Ideal Outcomes

3. Increased water quality

POROUS STREET DESIGN

Sylvan Ave Design

The image displays an aerial map of a residential neighborhood with a red line highlighting a section of Sylvan Ave. A red pin labeled 'A' is placed on the highlighted section. To the left is White St, and below are Dewey Ave and 800. To the right is 800 and 900. A scale bar at the bottom left shows 100 ft and 50 m. A north arrow and navigation icons are on the far left. Two technical cross-section diagrams are overlaid on the map, one above and one below the red line.

PERMEABLE PAVEMENT WITH WATERPROOF LAYER CROSS SECTION
APPLIED AT STA 0+53.81 TO 0+50.00

PERMEABLE PAVEMENT CROSS SECTION

Technical details from the diagrams include:
- 1/2" CONCRETE CURBS
- 1/2" FINISHED ASPHALT SURFACE
- 2" GENERAL 18K GRANULAR FILL
- 2" PERMEABLE LAYER (25% OVERLAY)
- 4" OPEN-GRANULAR (25% OVERLAY) 1/2"
- 4" OPEN-GRANULAR (25% OVERLAY) 1/2"
- 1/2" FINE SAND (25% OVERLAY) 1/2"
- 4" FINE SAND (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"
- 1" WOOD DEBRISTE FIBER (25% OVERLAY) 1/2"

POROUS STREET DESIGN

Ideal Design

Infiltrate run-off, attenuate peak discharge, and retain onsite. Often used in combination with vegetated area.

Sylvan Ave Design

Infiltrates runoff, attenuates peak discharge, but no retention onsite. It has an under drain that directs the runoff to the storm sewer.

PROJECT TIMELINE – COMPLETED TO DATE

POST CONSTRUCTION

A residential street in winter. The road is covered in snow and has dark tire tracks. On the left, there is a blue recycling bin with the word "RECYCLE" and "RUBROS" on it. In the background, there are houses, including a prominent blue and white one, and bare trees. On the right, several cars are parked along the curb. The sky is overcast.

DATA COLLECTION –

WHAT WE NEED TO ANSWER THE BIG QUESTION

1. How do the run-off volumes change before and after installation of the porous asphalt?
 - a) Is there less runoff and more infiltration? If so how much?
 - b) How do the runoff and infiltrated volumes compare to the total impervious drainage area?
 - c) How does the hydrograph curve change before and after installing the porous pavement?
2. If installing this application in conjunction with a bio-retention facility, how big would it need to be, and what event sizes could it handle before overflowing?
3. Do the residents see a decrease in runoff or standing water?
4. Do the residents see a decrease in flooding or sump pump usage?

MONITORING DESIGN – PROPOSED

Weir
Dimensions:

Figure 2 and 3. Isometric view of weir plat and pressure transducer - **Note – the figure is not drawn to scale, and the weir plate is actually much thinner.*

Photo Taken – 5/4/2010

Often standing water behind, And dry in front

Photo Taken – 5/26/2010

2 - foot sump, so
always standing water
on both sides

Input Parameters:

- Rainfall by event size
- Total Directly Connected Impervious Surface Area (DCIA)
- Pressure Head/Flow into catch basin from Sylvan Ave

City of AA S.
Industrial Rain
Gauge

Approximately
0.45 miles apart

**Estimated drainage Area
(sq ft)**

Total Block	107,139
Street and Sidewalk	38,794
Roof runoff (assuming 1500sqft)	43,500
Total DCIA	87,000

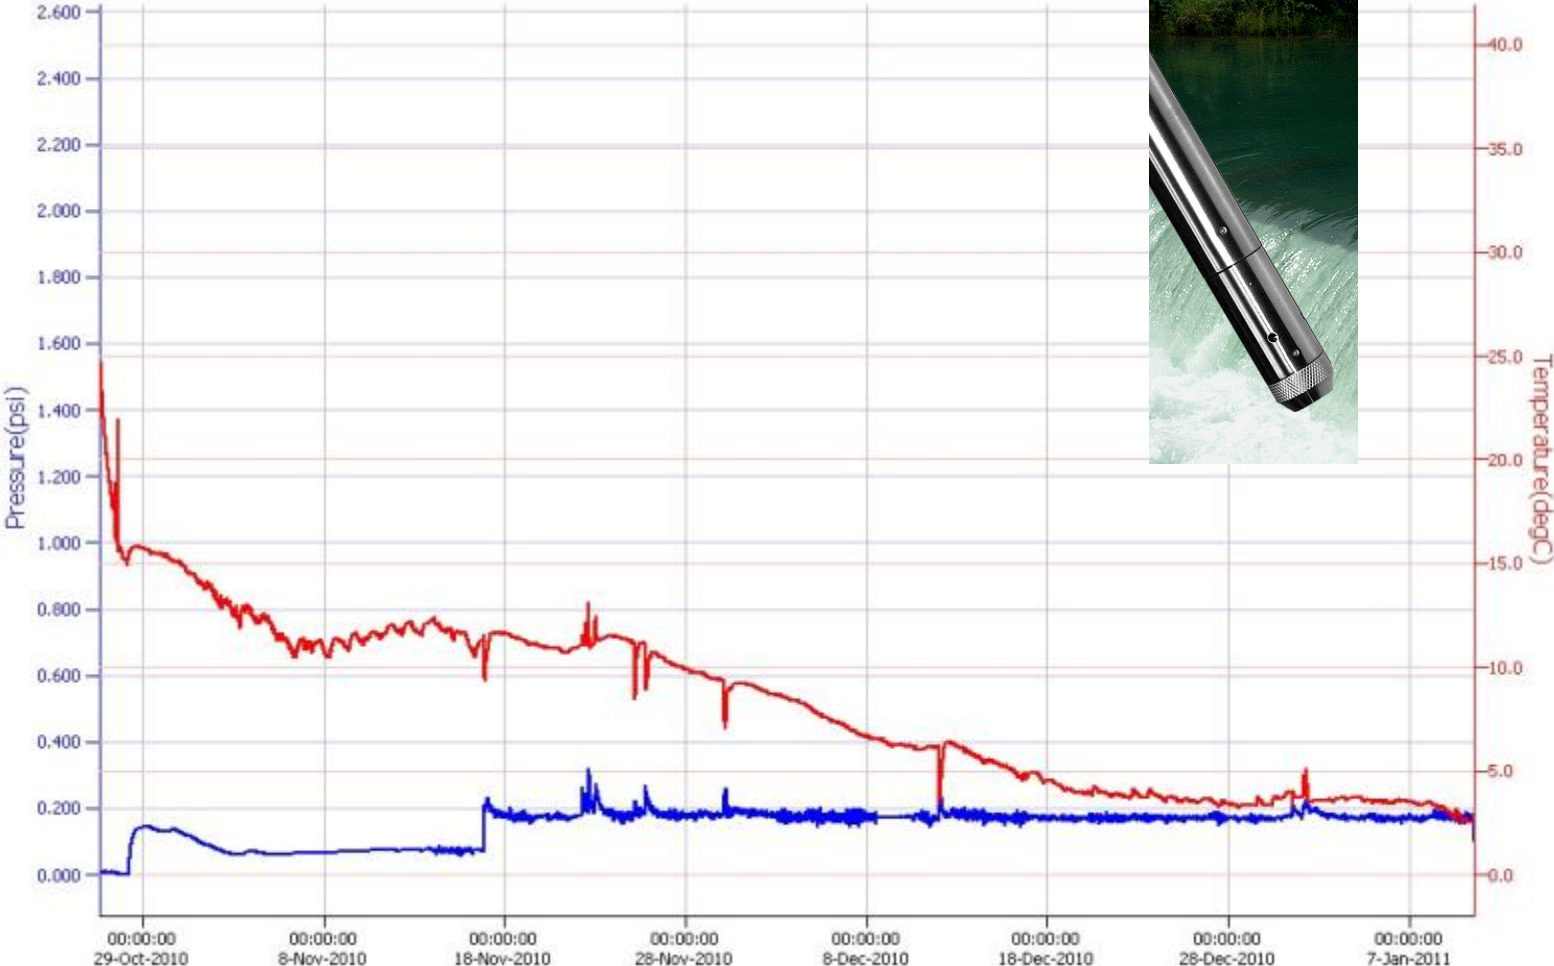

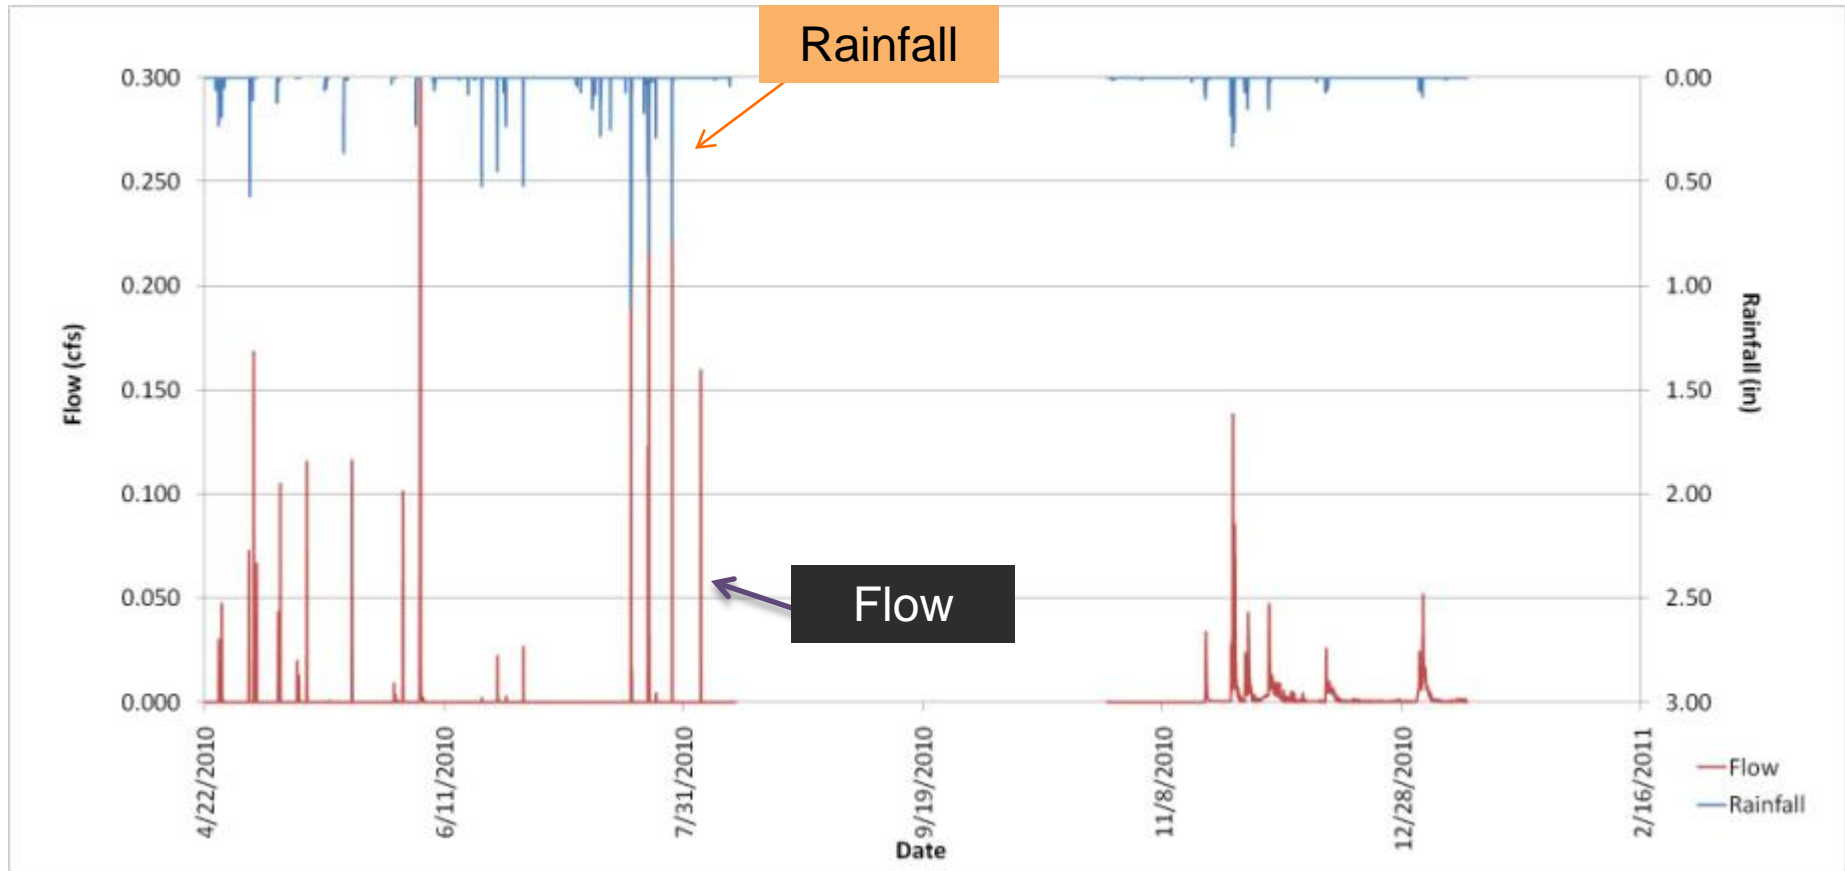

Measure

Area measurement
Segment: 556.122229 Feet
Perimeter: 1,654.246157 Feet
Area: 38,783.868327 Square Feet

102610_Slyvan Ave_f

Pre-construction:

All the runoff comes in all at once,
and exits all at once.

Post-construction:

Runoff comes in more slowly, but
there is more of it.

Pre-construction:

All the runoff comes in all at once,
and exits all at once.

Post-construction:

Runoff comes in more slowly, but
there is more of it.

Pre-construction:

All the runoff comes in all at once,
and exits all at once.

Post-construction:

Runoff comes in more slowly, but
there is more of it.

Total Volumetric Comparison	Estimated Total Runoff (ft ³)	Measured Total Runoff (ft ³)	Measured Total Runoff (gal)	Estimated maximum capacity per event* of a bioretention facility of 1,000 ft ² (gal)
April Sum	4,106	1,564	11,700	36,000
Nov Sum	4,364	3,863	28,897	

- The system is collecting more runoff after installation than before.
- Although there is more runoff entering the system it is doing so more slowly than before installation.
- The material does not roll-out flat – an idea that is counter to field technician & engineering comfort
- If the system were to be installed in another location, the under drain could be directed to a bio-retention facility of 1,000 sq ft, and it would likely have capacity for most event sizes up to 2 inches.

- Are the residents seeing a reduction in standing water on the street?
- Have the residents noticed a difference in their basement flooding and/or sump pump usage?
- Has the street been less icy than other surrounding (equally trafficked) streets?
- Has the maintenance crew seen a difference in the level of effort needed to maintain the street?

- Survey – Develop Questionnaire With City Input
- Economic Analysis:
 - Capital and O&M comparison for this location vs.
another
- Continued Monitoring And Analysis
